## Private Solution with VoIP and Remote iPBX

This option moves the iPBX server off-site to a secure data center. Using an off-site location combines the functionality of a privately owned system and the redundancy of the data center. Additional handsets or extensions can be added at a minimal cost. In the case of a failure of the internet connection to your business location, the iPBX will still be able to operate and forward extensions to alternate equipment – such as a cell phone – or voicemail.

### Benefits

All of the benefits of **Private Solution with Voice over IP (VoIP) Phone Service** with the redundancy option are present in this solution. In addition, a hybrid solution utilizing a combination of traditional phone service and a VoIP Provider can be present in this scenario – combining the reliability of traditional phone service with the cost savings of VoIP in a protected environment.

### Detractions

This scenario incurs the additional cost of co-locating the iPBX service while still requiring a high-speed internet connection on your site.
